

Overview

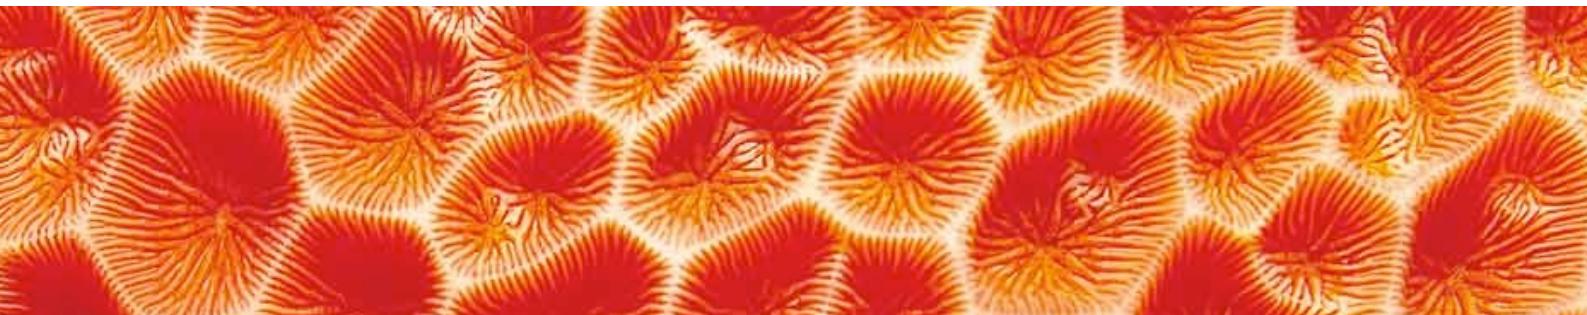

Analytical HPLC and UHPLC columns

Eurospher II for HPLC, HPLC Plus and UHPLC

Eurokat for LC separation of carbohydrates and organic acids

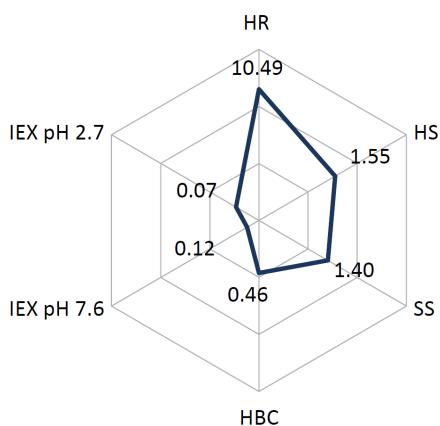

- Handy column hardware -> easy exchange of filters
- Integrated precolumn system -> no loss in separation power
- Wide area of application services -> column- and method guidance

Characterisation of phases based on Tanaka tests

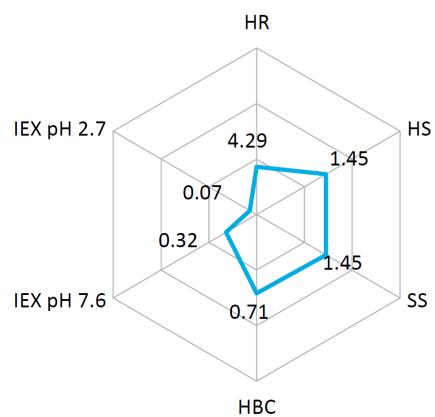

Optimized selectivity – for better separations

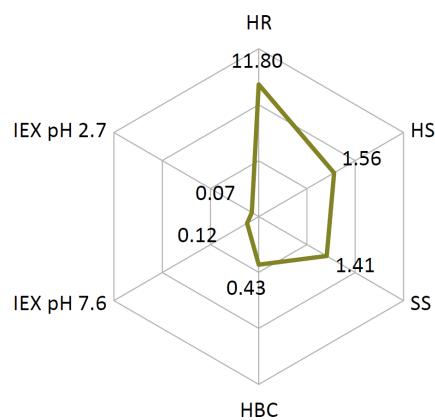

HR:	hydrophobic retention
HS:	hydrophobic selectivity
SS:	steric selectivity
HBC:	hydrogen bonding capacity
IEX (pH 7,6):	ion exchange capacity at pH 7.6
IEX (pH 2,7):	ion exchange capacity at pH 2.7

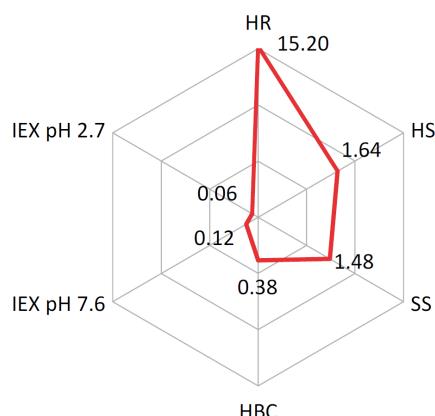

Eurospher II 100 C18 - USP L1 -
for acidic, basic and neutral analytes in reversed phase mode
(sulphonamides; anabolic steroids; anti-psychotics; beta blocker; Sudan dyes; phenols, preservatives etc.)

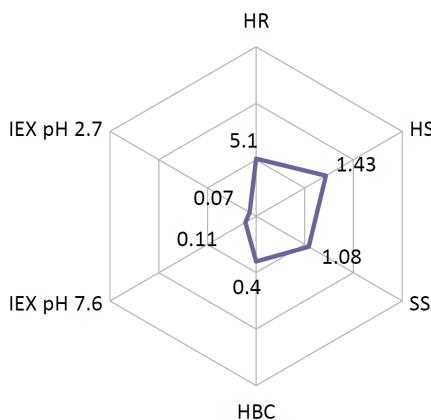

Eurospher II 100 C18 A - USP L1-
polar endcapped C18 phase for alternative selectivity; 100% aqueous applications with very polar compounds (basic pharmaceutical ingredients, water soluble vitamins, catecholamines as well as organic acids)

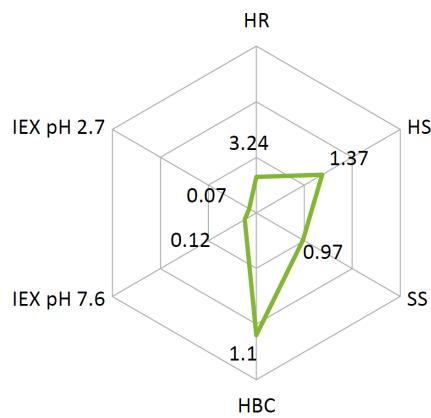

Eurospher II 100 C18 H - USP L1 -
recommended alternative for Kromasil 100 C18 columns; for acidic, basic and neutral analytes in reversed phase mode with extended pH range

Eurospher II 100 C18 P - USP L1 -
alternative selectivity to C18 phase; stationary phase in Eurospher II C18 family with the highest carbon load; fully endcapped; excellent shape selectivity and pH stability

Eurospher II 100 C8 - USP L7 -
similar selectivity to C18 phase but less retention due to the lower hydrophobicity; useful for determination of water soluble vitamins, steroids, catecholamines, sedatives etc.

Eurospher II 100 Phenyl - USP L11 -
alternative selectivity for aromatic and moderately polar analytes or mixtures with varying polarity and aromaticity

HILIC

Eurospher II 100 HILIC -
especially suited for the separation of hydrophilic, polar and ionic analytes which are only poorly retained on reversed phase columns; behavior is the other way round on Eurospher II HILIC compared to RP which makes it an ideal tool to enhance chromatographic separations for these molecules

NH₂

Eurospher II 100 NH₂- USP L8 -
most flexible phase in the Eurospher II family; can be used in three modes: normal phase, reversed phase and ion chromatography mode (weak anion exchanger); different selectivity to the silica packing; in reversed phase mode mainly used for analysis of carbohydrates

Eurospher II Family

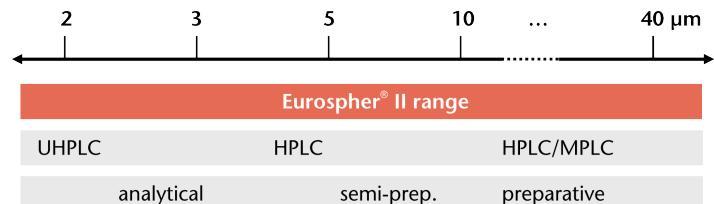

Based on an ultra pure spherical silica gel, Eurospher II is a high performance column material for analytical, semipreparative and process-scale applications. Eurospher II features very narrow particle and pore size distributions, as well as outstanding mechanical stability. Eurospher II silica gel is perfectly suited to take on routine analyses as well as the most ambitious chromatography tasks.

Especially for ultrafast UHPLC, Eurospher II is also available in 2 µm particle size.

Characteristics:

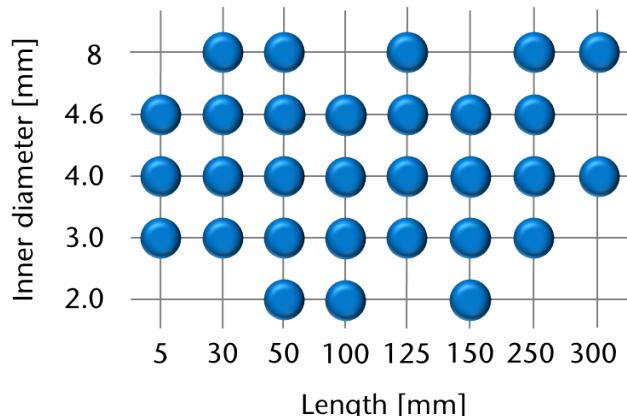

- Eurospher II 100 HPLC phases are based on ultra pure 3rd generation silica gel
- numerous modifications are available for a broad range of applications
- high resolution LC phase, suited for analytical HPLC and UHPLC as well as for semipreparative and preparative Separations
- high mechanical stability
- narrow particle and pore size distribution
- high batch to batch reproducibility

Physical properties:

Silica gel	ultrapure > 99.99 %
Metal content	< 10 ppm
Particle size	2 µm, 3 µm, 5 µm, 10 µm, (15 µm, 20 – 45 µm upon request)
Particle shape	spherical
Porengröße	100 Å
Specific surface	320 ± 20 m ² /g
Pore volume	0.8 ml/g
Density	430 g/l

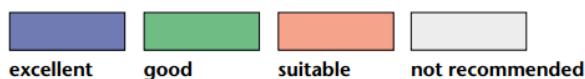

Available column dimensions*:

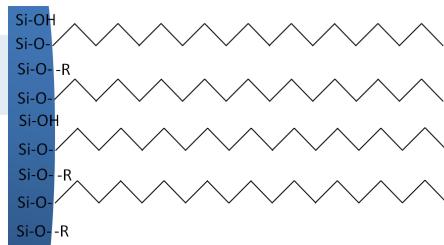

* preparative column dimensions up to 50 mm ID also available

Recommended application areas:

Phase type	non polar	polar	acidic	basic	Chelator	hydroph. retention	shape selectivity	extreme aqueous	pH > 9	LC-MS
C18										
C18 H										
C18 P										
C18 A										
Phenyl										
C8										
C8 A										
C4										
HILIC										
NH ₂										
CN										
Diol										
Si										

Eurospher II 100 C18 - USP L1 -

Ultra pure, spherical high performance HPLC phase based on silica gel
Unpolar, monomeric C18 (Octadecyl) modification, endcapped,
16 % carbon content (~ 50 % endcapping).

Properties:

Separation mechanism: Hydrophobic interaction

Key features:

High-class HPLC phase perfectly suited to take on routine analyses as well as the most ambitious chromatography tasks, classical C18 phase with ca. 50 % endcapping and resulting 16 % carbon content, outstanding mechanical and chemical stability

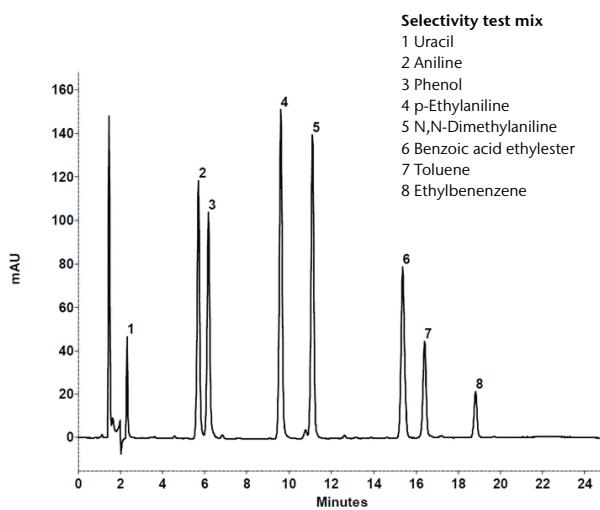

Technical data:

C18 phase based on ultra-pure silica gel (purity > 99 %),
metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 – 45 µm on request).

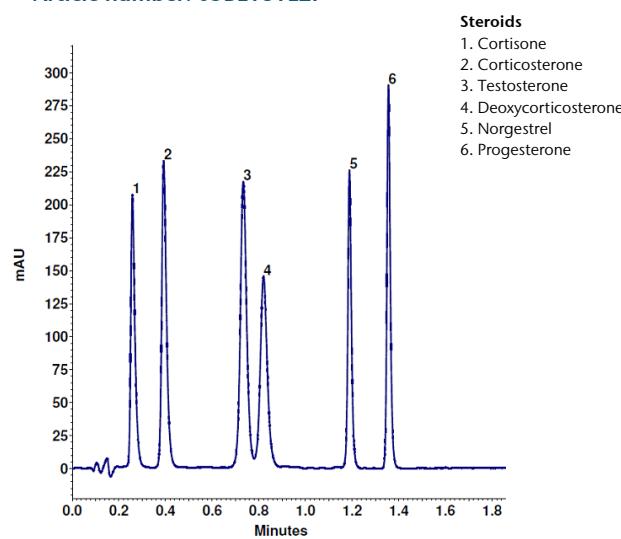

Recommended application areas:

Suitable for acidic, basic and neutral analytes in reversed phase mode, for example sulphonamides; anabolic steroids; anti-psychotics; beta blocker; sudan dyes; phenols and preservatives

Eurospher II 100-5 C18, 150 x 2.0 mm ID
Article number: 15BE181E2J

Eurospher II 100-2 C18, 50 x 2 mm ID
Article number: 05BE181E2F

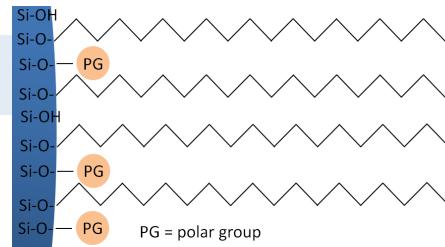

! **Tip:** Never use classical C18 phases with 100 % aqueous mobile phase. The hydrophobic C18 chains will collapse. Only special C18 A or C18 AQ phases have a hydrophilic andcapping style and can be used with pure water.

Eurospher II 100 C18 A - USP L1-

Ultra pure, spherical high performance HPLC phase based on silica gel
Polar, monomeric C18 (Octadecyl) modification, polar endcapping,
10 % carbon content (~ 50 % endcapping)

Properties:

Separation mechanism: Hydrophobic and polar interaction

Key features:

C18 A phase with alternative, more polar selectivity, suited for the use with pure aqueous mobile phases, 50 % endcapping and resulting 10 % carbon content, outstanding mechanical and chemical stability, suited for analytical as well as semi preparative and preparative applications

Technical data:

C18 A phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 – 45 µm on request).

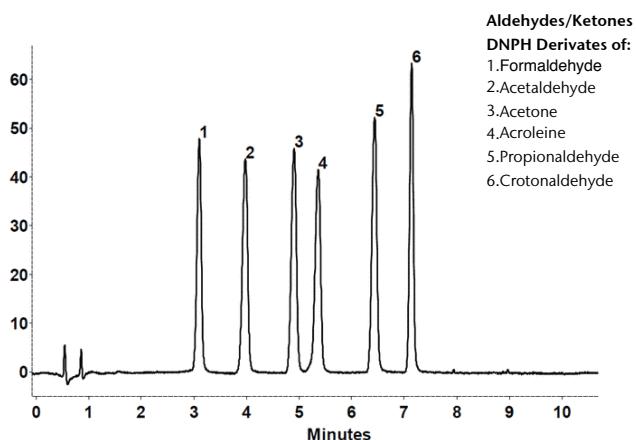

Recommended application areas:

polar endcapped C18 phase for water soluble and polar analytes, 100 % aqueous eluents for analysis of very polar compounds, basic pharmaceutical ingredients, water soluble vitamins, catecholamines as well as organic acids

Eurospher II 100-3 C18 A, 100 x 3 mm ID

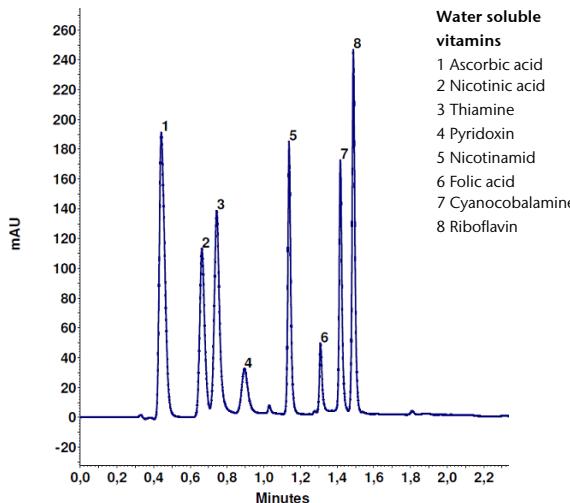

Article number: 10CE184E2G

MAU

Eurospher II 100-2 C18 A, 100 x 2 mm ID

Article number: 10BE184E2F

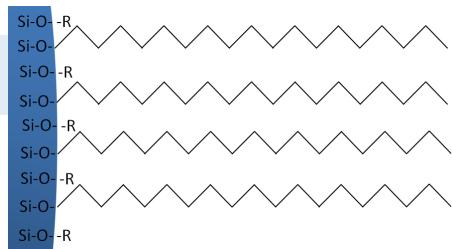

Tip: Caution! Even for short term storage all buffer solutions have to be rinsed from the column to prevent crystallization effects

Eurospher II 100 C18 H - USP L1 -

Ultra pure, spherical high performance HPLC phase based on silica gel

Unpolar, monomeric C18 (Octadecyl) modification, high efficiency endcapping,
17 % carbon content (~ 99 % endcapping)

Properties

Separation mechanism: Hydrophobic interaction

Key features:

Unpolar C18 phase with high efficiency endcapping and 17 % carbon content, therewith higher pH stability in the range of 1-12, outstanding mechanical and chemical stability, suited for analytical as well as semi preparative and preparative applications

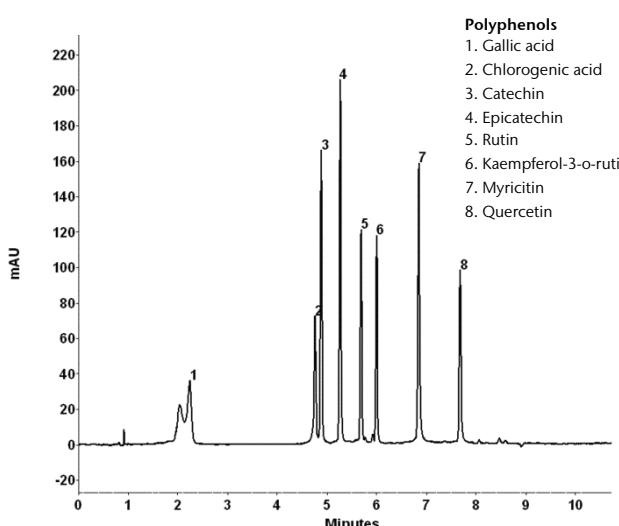

Technical data:

C18 phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 – 45 µm on request).

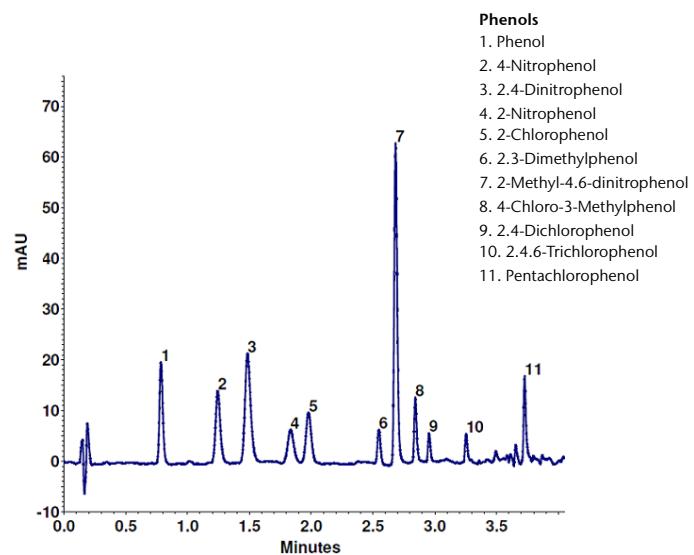

Recommended application areas:

Recommended alternative to Kromasil 100 C18, für acidic, basic and neutral analytes in reversed phase mode with extended pH range

Eurospher II 100-3 C18 H, 150 x 3.0 mm ID
Article number: 15CE185E2G

Eurospher II 100-2 C18 H, 50 x 2 mm ID
Article number: 05BE185E2F

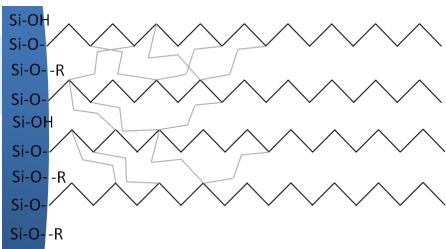

Tip: All analytical KNAUER columns can be used in reversed flow direction for example for cleaning

Eurospher II 100 C18 P - USP L1 -

Ultra pure, spherical high performance HPLC phase based on silica gel

Unpolar, trifunctional C18 (Octadecyl) modification, high efficiency endcapping
20 % carbon content (~ 99 % endcapping)

Properties

Separation mechanism: Hydrophobic and steric interaction

Key features:

KNAUER's most unpolar C18 phase, polymeric, high efficiency endcapping of 99 % and 20 % carbon content, higher pH stability in the range of 1-12, outstanding mechanical and chemical stability, suited for analytical as well as semi preparative and preparative applications

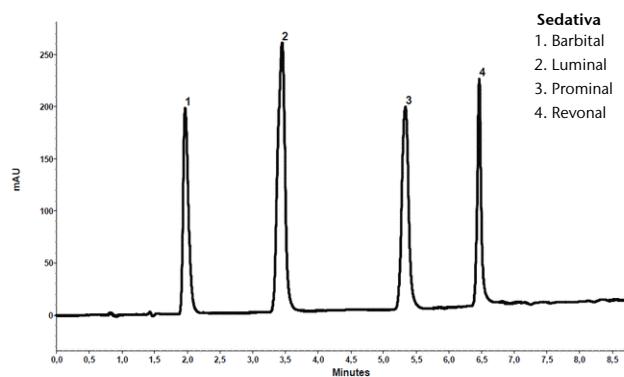

Technical data:

C18 phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 - 45 µm on request).

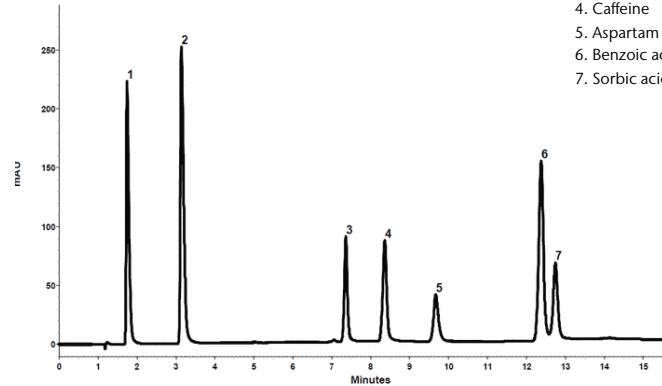

Recommended application areas:

alternative selectivity to standard C18; stationary phase in Eurospher II C18 family with the highest carbon load; fully endcapped; excellent shape selectivity and pH stability

Eurospher II 100-3 C18 P, 100 x 3.0 mm ID
Article number: 10CE182E2G

Eurospher II 100-3 C18 P, 100 x 3.0 mm ID
Article number: 10CE182E2G

Tip: Not all C18 phases are comparable! When replacing an existing column always have a close look at the characteristics like carbon load, pore size and specific surface area.

Eurospher II 100 C8 - USP L7 -

Ultra pure, spherical high performance HPLC phase based on silica gel
Monomeric C8 (Octyl) modification, standard endcapping
10 % carbon content (~ 50 % endcapping)

Properties

Separation mechanism: Hydrophobic interaction (lower compared to C18 phases)

Key features:

Classical C8 phase, standard 50 % endcapping and 10 % carbon load, outstanding mechanical and chemical stability, suited for analytical as well as semi preparative and preparative applications

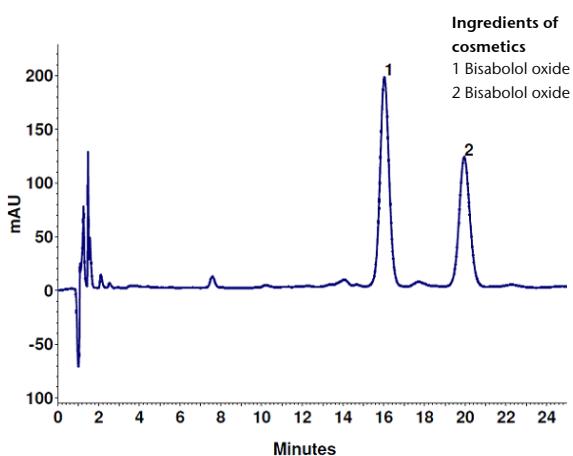

Technical data:

C8 phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 – 45 µm on request).

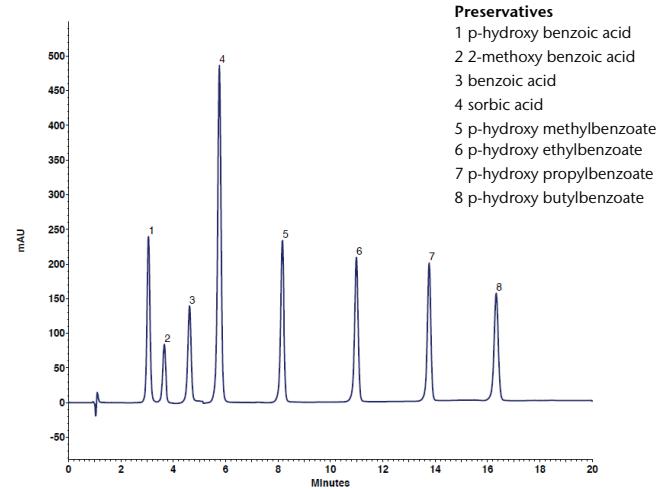

Recommended application areas:

Similar selectivity to C18 phase but less retention due to the lower hydrophobicity; useful for determination of water soluble vitamins, steroids, catecholamines, sedatives etc.

Eurospher II 100-5 C8, 150 x 4.6 mm ID
Article number: 15EE081E2J

Eurospher 100-5 C8, 125 x 4.0 mm ID
Article number: 12DE081ESJ

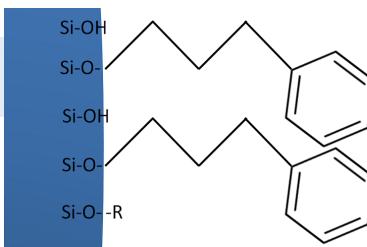

Tip: Column lifetime can be extended by using moderate conditions like temperatures not higher than 45 °C, backpressure below the maximum pressure and a good sample preparation.

Eurospher II 100 C8 article numbers

Eurospher II 100 Phenyl - USP L11 -

Ultra pure, spherical high performance HPLC phase based on silica gel
 Phenyl modification (Phenylpropyl),
 12 % carbon content

Properties

Separation mechanism: Pi-Pi Interactions

Key features:

Classical phenyl phase with 12 % carbon load, outstanding mechanical and chemical stability, suited for analytical as well as semi preparative and preparative applications

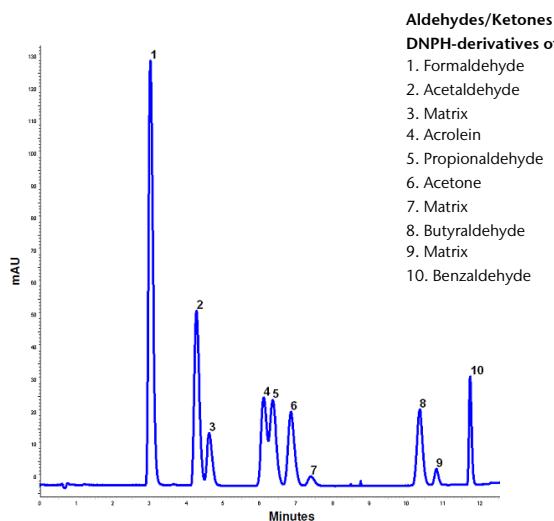

Technical Data:

Phenyl phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 – 45 µm on request).

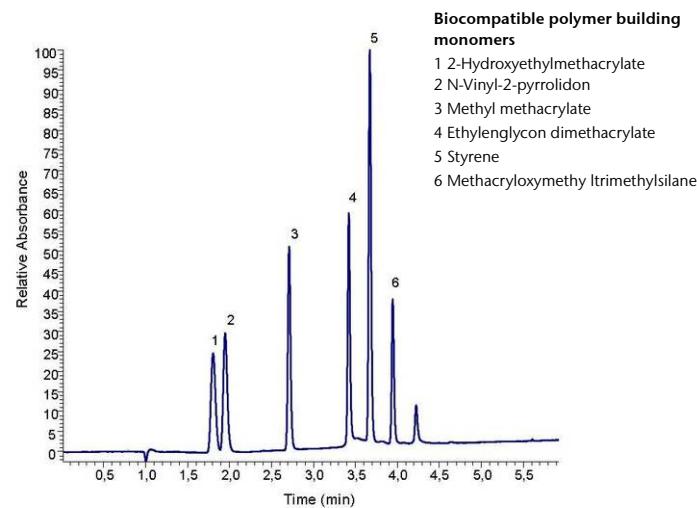

Recommended application areas:

Alternative selectivity for aromatic and moderately polar analytes or mixtures with varying polarity and aromaticity

Eurospher II 100-2 Phenyl, 100 x 2 mm ID
 Article number: 10BE050E2F

Eurospher II 100-2 Phenyl, 100 x 2 mm ID
 Article number: 10BE050E2F

Tip: For UHPLC columns like Eurospher II 2 µm particle size, samples and eluents should be filtered through a 0.2 µm instead of a 0.45 µm membrane filter. Frits at column in- and outlet have smaller pores than classical HPLC columns and block more easily.

Eurospher II 100 HILIC

Ultra pure, spherical high performance HPLC phase based on silica gel

Zwitterionic modification: Ammonium – sulfonic acid,
7 % carbon content

Properties

Separation mechanism: Hydrophilic and weak electrostatic interactions

Key features:

Modern HILIC phase with zwitterionic modification on the basis of ammonium- sulfonic acid, outstanding mechanical and chemical stability

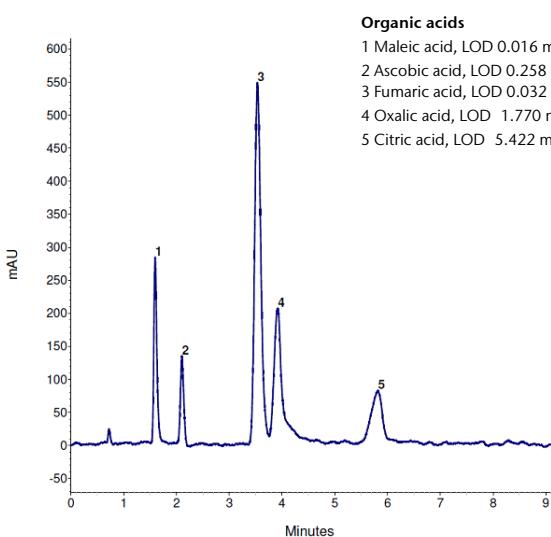

Technical Data:

HILIC phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 3 µm and 5 µm

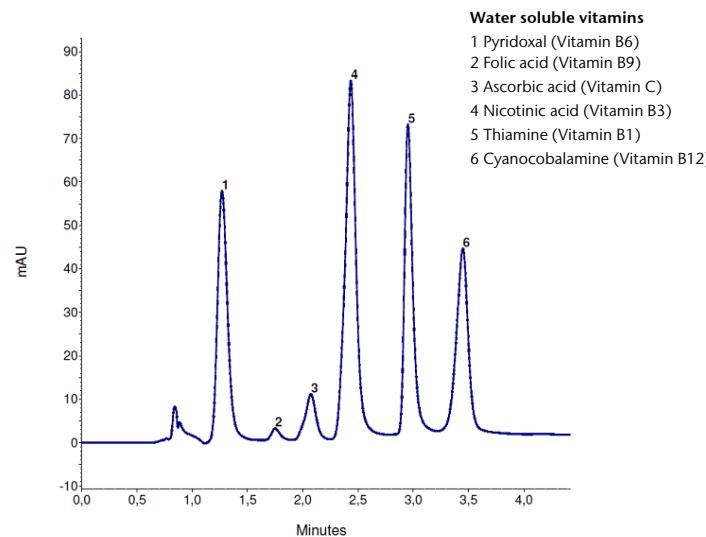

Recommended application areas:

Especially suited for the separation of hydrophilic, polar and ionic analytes which are poorly retained on reversed phase columns; behavior is the other way round on Eurospher II HILIC compared to RP which makes it an ideal tool to enhance chromatographic separations for these molecules

Eurospher II 100-5 HILIC, 150 x 3 mm ID
Article number: 15CE120E2J

Eurospher II 100-5 HILIC, 150 x 3 mm ID
Article number: 15CE120E2J

Tip: HILIC applications are well-suited for coupling with MS detection. The high organic content of the applied mobile phases are qualified well for evaporation in the MS's ionization source.

Eurospher II 100 NH2- USP L8 -

Ultra pure, spherical high performance HPLC phase based on silica gel
Amino modification (Aminopropyl),
4 % carbon content (without endcapping)

Properties

Separation mechanism: Hydrophilic and ionic interactions

Key features:

Multi mode column for RP, NP, HILIC and IC, Aminopropyl modification without endcapping, outstanding mechanical and chemical stability

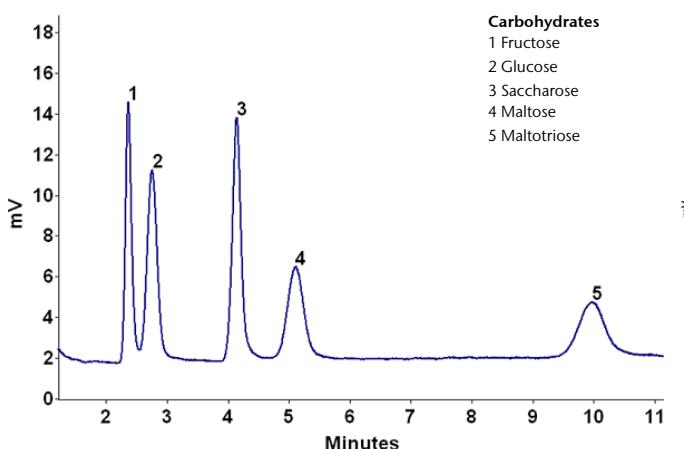

Technical Data:

Amino phase based on ultra-pure silica gel (purity > 99 %), metal content < 10 ppm, pH-stability 2 - 8, pore size 100 Å, particle size 2 µm, 3 µm, 5 µm, 10 µm (15 µm, 20 – 45 µm on request).

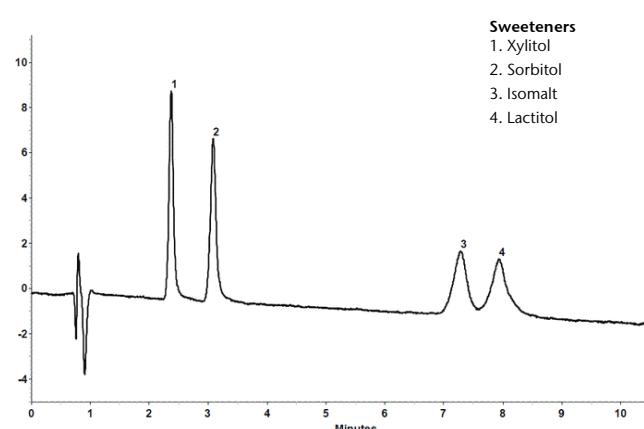

Recommended application areas:

Most flexible phase in the Eurospher II family; can be used in three modes: normal phase, reversed phase and ion chromatography mode (weak anion exchanger); different selectivity to the silica packing; in reversed phase mode mainly used for analysis of carbohydrates

Eurospher II 100-3 NH2, 100 x 3.0 mm ID
Article number: 10CE190E2G

Eurospher II 100-3 NH2, 100 x 3.0 mm ID
Article number: 10CE190E2G

Tip: A precolumn can help to protect your analytical column. Especially when working with highly matrix afflicted samples it is highly recommended to use precolumns.

High performance polymer phase for the analysis of organic acids, carbohydrates and alcohols.
Available in the ionic forms H, Ca, Pb, Na und Ag.

Characteristics

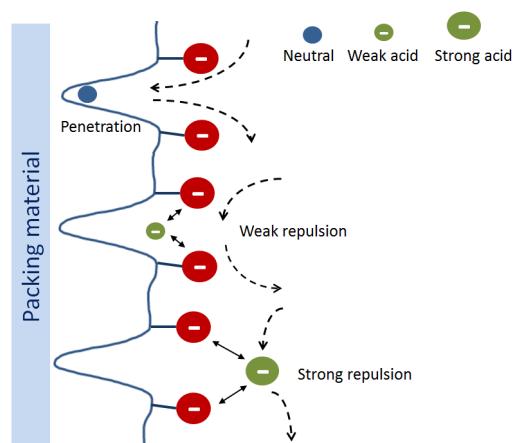

Eurokat high performance polymer phases were especially developed for the separation of organic acids, carbohydrates, alcohols and even complex mixtures of these compounds.

Eurokat is a sulfonated cross-linked styrenedivinylbenzene copolymer available in several ionic forms (H, Ca, Pb and Ag). This particular cation exchanger is characterized by an outstanding density of functional groups, making it the ideal choice for your ion exclusion, size exclusion and ligand exchange chromatography.

Principle of ligand exchange mechanism

Principle of ion exclusion mechanism

Stability

Eurokat polymer columns are extremely stable over the whole pH range. This is one striking advantage compared with silica-based phases which have a limited lifetime at pH extremes, especially in the higher pH range. Most importantly, Eurokat phases show extraordinary column lifetime stability and are not affected by aqueous solvents.

Choice of chromatographic conditions

The Eurokat stationary phase is designed to be applicable to a wide range of diverse chromatographic conditions. All Eurokat columns can be used at temperatures up to 90 °C with no organic solvents. The best separation of sugars can be achieved using between 60 to 90 °C. To extend separation performance, it is possible to connect up to three columns of Eurokat in series. Eurokat columns require no organic solvents and thus are environmentally friendly.

Physical properties:

Particle size	10 µm, 25-56 µm
Cross-linkage	ca. 8 % (H-Form)
	ca. 6 % (Ca, Pb, Na, Ag-Form)
	higher cross linkage means smaller pore size
Max. pressure	up to 100 bar
Max. temperature	up to 90 °C

Application areas:

- Carbohydrates and organic acids in softdrinks and fruit juices
- Sugar substitutes
- Food preservatives
- Dairy products
- Urine analytic (Uric acid, Hippuric acid)
- Monitoring of fermentation processes

Eurokat H - USP L17 -

Polymer phase for the determination of organic acids, carbohydrates and alcohols
H-form, 8 % cross linkage, USP L17.

organic solvent
free operation

Properties

Cation exchanger, extremely long lasting lifetime when correctly handled, best results with aqueous eluents and small amounts of anorganic acids, recommended eluent 0,01 N sulfuric acid, usage of up to 10 % organic content in the mobile phase is possible

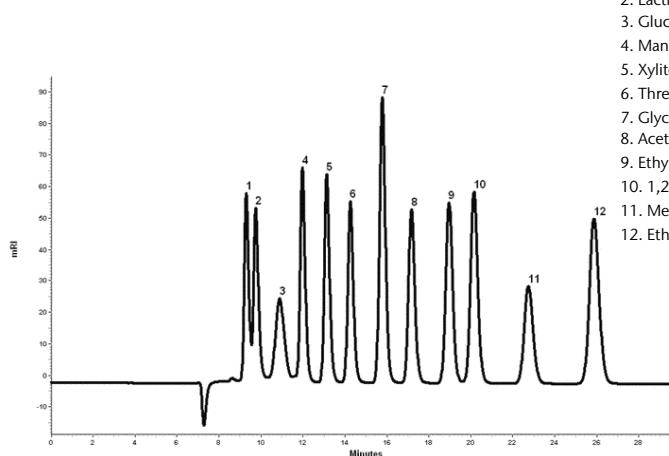

Technical Data:

Sulfonated cross-linked styrenedivinylbenzene copolymer with 8 % cross linkage in the ionic form H, available in 10 µm particle size, pressure stable up to maximum 100 bar.

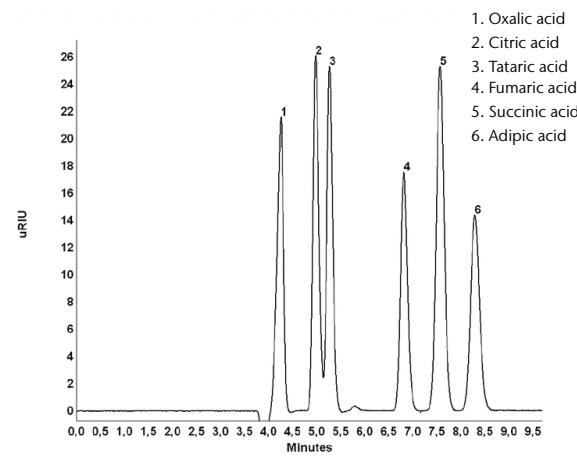

Recommended application areas:

Eurokat H is especially designed for the analysis of organic acids and even complex mixtures of acids, sugars and alcohols as well as sugar alcohols.

Eurokat H 10 µm, 300 x 8 mm ID
Article number: 30GX340EKN

Eurokat H 10 µm, 300 x 8 mm ID
Article number: 30GX340EKN

Tip: Eurokat columns are characterized by an extremely long lifetime if handled properly. Especially pressure shocks and organic solvent contents of more than 10 % in the mobile phase should be avoided absolutely.

Eurokat H article numbers

100 g	00CX340EKN	

Eurokat Pb & Ca- USP L 34 / USP L19 -

Polymer phase for the determination of mono- and disaccharides
Pb (USP L34) or Ca (USP L19) form, 6 % cross linkage

organic solvent
free operation

Properties

Cation exchanger, extremely long lasting lifetime when correctly handled, best results with aqueous eluents, recommended eluent is pure deionized water, usage of up to 10 % organic content in the mobile phase is possible

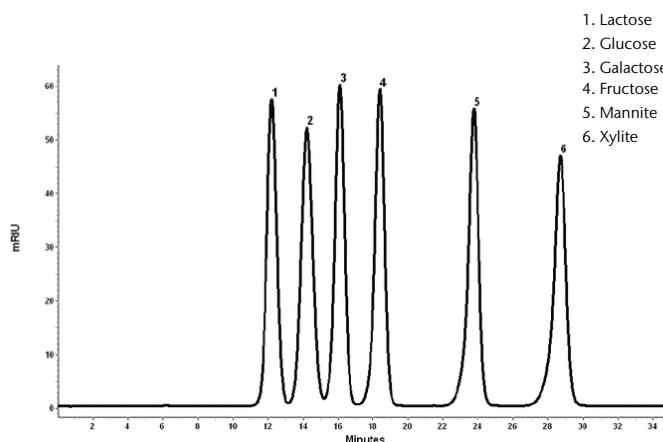

Technical Data:

Sulfonated cross-linked styrenedivinylbenzene copolymer with 6 % cross linkage in the ionic form Pb or Ca, available in 10 µm particle size, pressure stable up to maximum 100 bar.

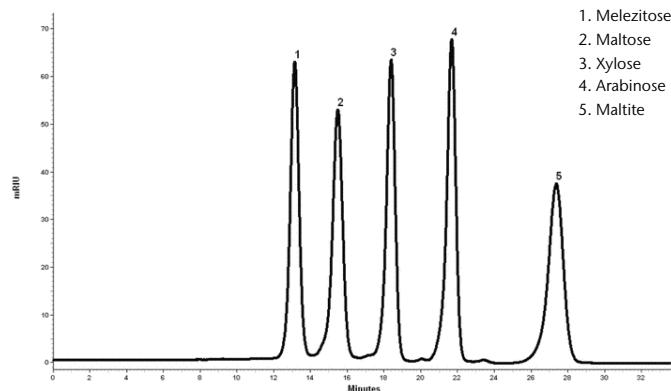

Recommended application areas:

Especially designed for the analysis of small carbohydrates up to DP 4.

Eurokat Ca, 300 x 8 mm ID
Article number: 30GX360EKN

Eurokat Pb, 300 x 8 mm ID
Article number: 30GX350EKN

Tipp: Eurokat columns are used at high temperatures. During equilibration it is very important to have an eye on the backpressure and to start with very low flow rates and increase them only slowly and stepwise after the column has adapted to the temperature.

Eurokat Ag & Na

Polymer phase for the determination of sugar oligomers
Ag or Na form, 6 % cross linkage.

organic solvent
free operation

Properties

Cation exchanger, extremely long lasting lifetime when correctly handled, best results with aqueous eluents, recommended eluent is pure deionized water, usage of up to 10 % organic content in the mobile phase is possible

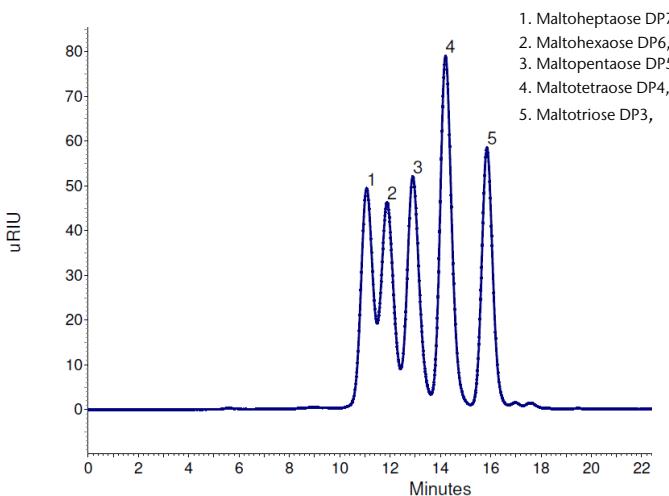

Technical Data:

Sulfonated cross-linked styrenedivinylbenzene copolymer with 6 % cross linkage in the ionic form Ag or Na, available in 10 µm particle size, pressure stable up to maximum 100 bar.

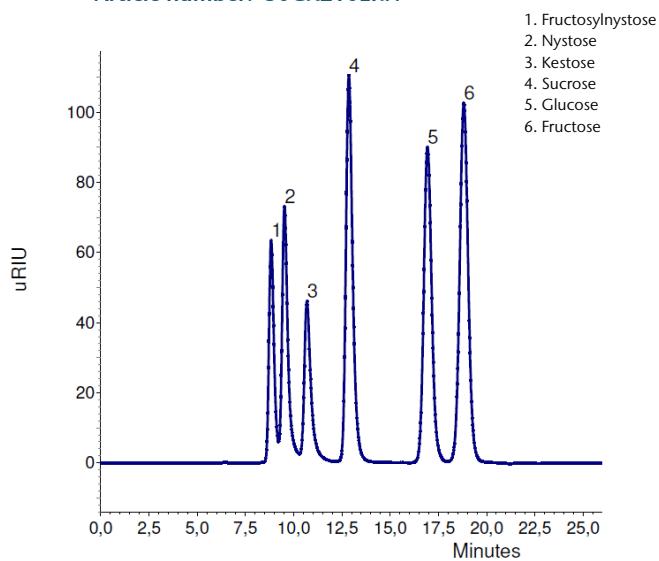

Recommended application areas:

Especially designed for the analysis of sugar oligomers, separates carbohydrates up to DP 8.

Eurokat Ag, 300 x 8 mm ID
Article number: 30GX380EKN

Eurokat Na, 300 x 8 mm ID
Article number: 30GX210EKN

Tip: Eurokat columns are typically used with 100% aqueous eluents. For storage, please avoid microbial growth by storing Eurokat columns at 4 °C.

Equilibration, regeneration and storage of silica gel based columns like Eurospher II

Proper storage of silica based HPLC columns

Silica based columns should be stored in an aprotic solvent. The best solvent for storage of RP packings (C18, C8, C4, C1, C30, CN and Phenyl) is acetonitrile/water (50:50 v/v). The water content should not be greater than 50%. The best solvent for storage of NP packings (Silica, Diol, Nitro, Cyano and Amino) is hexan/isopropanol 90:10 (v/v). The best solvent for storage of columns used in HILIC mode (HILIC, Amino, and Silica) is acetonitrile/water (90:10 v/v) or acetonitrile/5 mM ammonium acetate, pH 5,3 (90:10 v/v). Acetonitrile content should always be greater than 90 %.

Caution! Even for short-term storage, flush out all buffer solution from the column to prevent algal growth. Make sure that all buffers are washed out of the column before exchanging aqueous mobile phases by organic solvents. Buffer salts are not soluble in acetonitrile and can block capillary tubing and the column.

Equilibration

The equilibration time of a column depends on the column dimensions. In general, a column is equilibrated after 20 column volumes are flushed through it. The equilibration times for the most important column dimensions are summarized in the following table. You can reduce the equilibration time by simply increasing the flow rate. However, make sure to flush the column with at least 10-20 column volumes to make sure the column is equilibrated.

Eurospher II columns with 2 µm particle size, UHPLC:

Column dimension (Length x ID)	Column volume [ml]	Flow rate [ml/min]	Equilibration time [min]
50 x 2 mm	0.11	0.5	3
100 x 2 mm	0.21	0.5	6

Eurospher II columns, classical HPLC:

Column dimension (Length x ID)	Column volume [ml]	Flow rate [ml/min]	Equilibration time [min]
250 x 4.6 mm	2.82	1.0	28
150 x 4.6 mm	1.69	1.0	17
100 x 4.6 mm	1.13	1.0	12
50 x 4.6 mm	0.56	1.0	6
250 x 4.0 mm	2.14	1.0	22
150 x 4.0 mm	1.28	1.0	13
125 x 4.0 mm	1.07	1.0	11
250 x 3.0 mm	1.20	0.6	20
150 x 3.0 mm	0.72	0.6	12
100 x 3.0 mm	0.48	0.6	8
50 x 3.0 mm	0.24	0.6	4
250 x 2.0 mm	0.53	0.25	21
150 x 2.0 mm	0.32	0.25	13
100 x 2.0 mm	0.21	0.25	9
50 x 2.0 mm	0.11	0.25	5

Equilibration, regeneration and storage of silica gel based columns like Eurospher II

Regeneration of a column

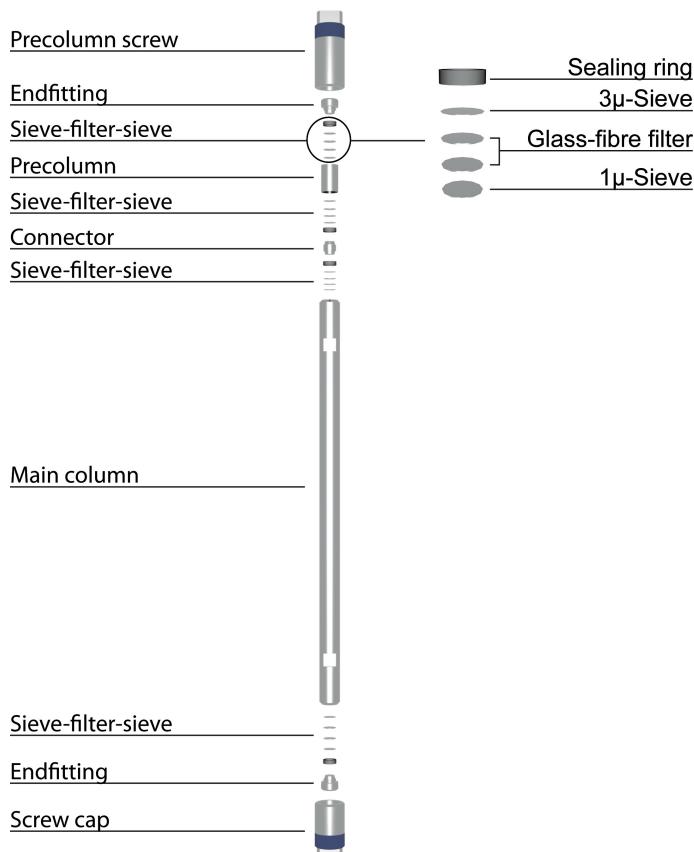

We recommend regenerating a column if a change in peak form, retention time, resolution or an increase in backpressure is observed. If the system pressure begins to rise, remove the column and check the system to find whether the pressure increase is being caused by the system or the column.

Pressure increase caused by system: flush system, exchange eluent filters, frits and/or blocked capillaries.

Pressure increase caused by column: backflush the column carefully to remove particle buildup from the inlet frit (connect the column outlet to the pump/injector and flush).

Do not connect the column to the detector.

Buildup of KNAUER VERTEX PLUS columns with 3.0 to 4.6 mm ID

If the column still has a high backpressure, flush the column according to the following regeneration scheme:

Regeneration scheme for RP columns (C18, C8, C4, C1, C30, CN and Phenyl stationary phases)	Regeneration scheme for NP columns (Silica, Diol, Nitro, Cyano and Amino stationary phases)	Regeneration scheme for columns used in HILIC mode (HILIC and Silica stationary phases)
20 column volumes water	20 column volumes heptane	20 column volumes water
20 column volumes acetonitrile	5 column volumes isopropanol	30 column volumes 0.5 M ammonium acetate
5 column volumes isopropanol	20 column volumes acetonitrile	30 column volumes water
20 column volumes heptane	20 column volumes water	20 column volumes acetonitrile/water (50:50 v/v)
5 column volumes isopropanol	20 column volumes acetonitrile	20 column volumes acetonitrile
20 column volumes acetonitrile	5 column volumes isopropanol	20 column volumes acetonitrile/water (50:50 v/v)
	20 column volumes heptane	

After the regeneration procedure, re-equilibrate the column with the mobile phase before analyses.

Eurokat® Column Care and Regeneration

Column maintenance tips

- The maximum pressure limit during operating should not be exceed 90 bar. The maximum pressure for the column material is 100 bar.
- Forceful mechanical handling (bumps, shocks) as well as sudden temperature changes should be strictly avoided to conserve the homogeneity of the packed column bed.
- Water used in preparation of the mobile phase should be either fresh double-distilled or HPLC-grade.
- All reagents used in sample preparation (solvents, reference compounds, etc.) should be of p.a. grade. Particulate matter and precipitates must be removed from the sample by filtration before injection.
- Changes in column temperature should only be undertaken under continuous eluent flow. As a principle, drastic temperature changes should always be carried out in gradual steps.
- The optimal temperature range for the analysis of carbohydrates is between 60 and 90°C.
- During heating process from room temperature keep the flow low at 0.1 ml/min for 4 mm and 0.2 ml/min for 8 mm columns until 60 °C.
- Flow rate changes should also only be carried out stepwise.
- Optimal flow rates are typically between 0.1 – 0.2 ml/min for 4 mm diameter columns and 0.4 – 0.8 ml/min for 8 mm diameter columns.
- If the column is not to be used for a longer period, the inlet and outlet should be sealed with appropriate blind fittings to prevent the polymer material from drying out. For longer term storage, the column should be kept at 8°C to avert bacterial growth.

Column Regeneration Procedure

- Eurokat columns can be regenerated in their corresponding ionic form. Regeneration of the polymer resin is important to maintaining the selectivity and lifetime of the column material. If metal ions or organic components are present in the sample, these materials may settle on the resin material or even react with the polymer, resulting in a gradual loss of column performance. Through periodic cleaning of the column, lifetime and performance can be significantly prolonged. To clean the resin, Eurokat Pb, Ca, Na and Ag columns should be flushed for at least 4 hours (preferably overnight) with double-distilled water at a flow rate of 0.2 ml/min (8 mm ID column) in the reverse direction at 60-75 °C. Eurokat H columns can be cleaned in a similar manner but require 0.01 N sulfuric acid.
- The column should then be rinsed for an additional hour with the same cleaning eluent in the normal flow direction at 75-85 °C. Maintaining this flow direction and temperatur, Eurokat Pb, Ca, Na and Ag columns should then be purged with a mixture of 10 % acetonitrile and 90 % water. Eurokat H columns should be purged with 10 % acetonitrile and 90 % 0.01 N sulfuric acid.

After this cleaning process, the columns are to be regenerated as follows:

- Eurokat Pb: purge with 0.25 mol/l lead nitrate at 75-85 °C at a flow rate of 0.2 ml/min (8 mm ID column) for about 4-6 hours
 - Eurokat Ca: purge with 0.25 mol/l calcium nitrate at 75-85 °C at a flow rate of 0.2 ml/min (8 mm ID column) for about 4-6 hours
 - Eurokat Na: purge with 0.25 mol/l sodium chloride or 0.1 mol/l sodium hydroxide at 75-85 °C at a flow rate of 0.2 ml/min (8 mm ID column) for about 4-6 hours
 - Eurokat Ag: purge with 0.25 mol/l silver nitrate at 75-85 °C at a flow rate of 0.2 ml/min (8 mm ID column) for about 4-6 hours
 - Eurokat H: purge with 0.05 mol/l sulfuric acid at 75-85 °C at a flow rate of 0.2 ml/min (8 mm ID column) for 4-6 hours
-
- Once this procedure has been completed, the desired flow rate may be resumed gradually. The column is now ready for further analyses and can be put back into normal use once having gradually reached the working temperature.

Column using tips

In general it is recommended that a precolumn (30 x 8 mm or 30 x 4 mm) be used. In order to eliminate undissolved particles or precipitates, the sample should be filtered through a 0.45 µm filter unit. Particulate matter in the eluent is removed by installing a column inlet filter between the injector and the column. To avoid contaminating the detector's measurement cell, neither the cleaning solution nor the regenerant should pass through the measurement cell.
